driven to improve

LS1 May 2016 update

We care about our customers, high quality service is part of our mission. Whenever we improve our products, we ensure our existing customers can profit too. Over the years the LS1 has seen some significant improvements, reason why the current LS1 sounds better than the LS1 from a couple of years back. We achieved this by improving the hardware and DSP filtering, resulting in lower jitter and an improved frequency response. Also the stability in interfacing and during start up has improved.

All previous versions of the LS1 can profit from these improvements. The 'May 2016 update' will bring your systems' electronics up to date which leads to an improved stability and a better sound quality. The top end sounds more silky and transparent and the overall experience is more natural. As mix engineer Wessel Oltheten described it: "After the update the LS1 sounds even more real, you hear more music and less loudspeaker".

*„More music,
less loudspeaker“*

Wessel Oltheten, mix engineer
